

How these features proposed are Relavant to DatIQ expansion, rank and rate them in terms of market positioning , GTM, Lead generation ton conversation both DatIQ itself and in general DatIQ feature offerings. How these features will help DatIQ as a product itself and alignment to roadmap. Also rank them in features build efforts, benefits, conversions realisation and other relalavent parameters. Give me BRD, PRD consideration to product build and implementation

DatIQ should expand through features that convert its existing URL extraction engine into **repeatable business workflows**: acquire a user through a useful template/report, activate them through a completed business outcome, and retain them through scheduled intelligence and integrations. The highest-priority build sequence is **Templates & Shareable Reports → Account Intelligence / Bulk Enrichment → Competitor Watchlists with AI-explained changes → Native signal routing**.

This direction is well aligned with DatIQ's existing platform: public-URL intelligence, custom extraction, enrichment, scheduling/monitoring, SEO/GEO/AEO capability, lead-generation pipelines, and integrations with HubSpot, Slack, Airtable, Notion, Zapier, Google Sheets, and related workflow destinations. Its current Vite/React, Netlify serverless, Supabase, Resend, and Razorpay/Stripe base supports this roadmap without requiring a platform rewrite.^[1]

Strategic Product Thesis

DatIQ should **not** position itself as one more generic scraper, nor try immediately to become Clay, ZoomInfo, Apify, Crayon, or a full BI platform.

The defensible product category is:

DatIQ is an AI-powered web intelligence workspace that turns public web data into qualified accounts, competitor insights, and automated business actions.

That positioning is stronger than “extract anything from any URL” because it tells a buyer what economic outcome they receive:

Persona	Current manual job	DatIQ outcome	Commercial value
Sales / SDR	Research prospect accounts before outreach	Sales-ready account brief, contacts, qualification, personalization angles	More qualified pipeline; less prospect research time
RevOps / Growth	Clean, enrich, score, and route lead lists	Enriched, deduplicated, ranked accounts sent to CRM/workflow	Better conversion and lower wasted SDR effort
Product Manager	Monitor competitors' sites, pricing, features, and messages	Structured competitor watchlist and actionable weekly intelligence digest	Faster strategic response; reduced manual research
PMM	Maintain battlecards and track positioning shifts	Evidence-based messaging, claims, pricing, and customer proof updates	Better enablement and positioning

Persona	Current manual job	DatIQ outcome	Commercial value
SEO / Content	Audit pages and competitor content manually	URL, domain, GEO/AEO, links, headings, and content-gap intelligence	Faster content production and audit delivery
VC / Analyst	Conduct repetitive pre-call/company research	Instant due-diligence brief with supporting source links	Shorter research cycle; stronger investment preparation
Agency / Consultant	Repeat research for multiple clients	Branded reports, workspaces, exports, scheduled monitoring	Higher project margin and recurring retainers

DatIQ should initially win **Sales/RevOps and Product/PMM**. The same underlying intelligence objects can later serve agencies, e-commerce/pricing, investment research, procurement, and compliance.

Feature Prioritization Scorecard

Scoring Method

Use a modified RICE-plus-commercial model. Standard RICE scores features using:

$$\text{RICE} = \frac{\text{Reach} \times \text{Impact} \times \text{Confidence}}{\text{Effort}}$$

For DatIQ, add the criteria that matter for a bootstrapped B2B SaaS business:

- **Strategic fit:** Alignment with existing URL extraction, enrichment, monitoring, scheduling, and integration assets.
- **GTM leverage:** Ability to create a clear landing page, demo, outbound hook, case study, or SEO keyword cluster.
- **Lead-generation leverage:** Whether the feature helps DatIQ itself identify, qualify, research, and convert prospects.
- **Activation impact:** Whether it helps a new user reach a visible “aha” outcome within one session.
- **Retention / monetization:** Whether it makes the product recurring, collaborative, or usage/credit expandable.
- **Engineering effort:** Relative effort for DatIQ’s existing stack; 5 is hardest.
- **Risk/dependency:** Dependence on volatile third-party APIs, anti-bot systems, compliance uncertainty, or heavy support overhead.

The recommended weighted score is:

$$\text{DatIQ Priority Score} = 0.20S + 0.20G + 0.15A + 0.15R + 0.15M + 0.10L - 0.05E$$

Where:

- S = strategic fit
- G = GTM leverage
- A = activation impact
- R = retention impact
- M = monetization potential
- L = lead-generation leverage
- E = implementation effort/risk

For a single founder, this should be reviewed every two weeks using actual usage and customer-interview evidence. RICE is particularly useful when impact is measured through new ARR, expansion ARR, and churn prevention—not merely feature votes. ^{[2] [3] [4] [5]}

Ranked Portfolio

Rank	Feature initiative	Strategic fit	GTM leverage	DatIQ lead-gen use	Activation	Retention / monetization	Build effort	Risk / dependency	Priority score	Roadmap
1	Persona-specific template gallery	10	10	9	10	7	2/5	Low	94/100	Now
2	Shareable intelligence reports	9	10	8	8	8	2.5/5	Low	90/100	Now
3	Account Intelligence / bulk enrichment	10	9	10	9	9	3.5/5	Medium	89/100	Now-Next
4	Competitor watchlist + AI-explained field diffs	10	9	8	8	10	3.5/5	Medium	88/100	Next
5	Native signal routing / action rules	9	8	9	7	10	3/5	Medium	85/100	Next
6	Product-qualified lead (PQL) scoring and lifecycle automation	9	8	10	8	9	2.5/5	Low	85/100	Now-Next
7	Integration recipe gallery	9	8	8	7	8	2/5	Low	84/100	Now
8	SEO/GEO/AEO audit workflows and content-gap reports	9	9	7	8	7	2.5/5	Low	83/100	Next
9	Agency/client workspaces and white-label reports	8	8	7	6	9	3.5/5	Medium	79/100	Later
10	Customer-proof / case-study intelligence	8	8	8	7	7	2.5/5	Low	78/100	Next
11	Structured sales-sequence personalization	8	8	9	7	7	3/5	Medium	77/100	Later
12	Community/review intelligence: Reddit, G2, Capterra, HN	7	9	7	7	8	4/5	High	73/100	Later
13	Third-party waterfall enrichment	7	8	9	7	9	4/5	High	72/100	Later
14	E-commerce competitor price intelligence	7	8	6	7	9	4/5	High	70/100	Later vertical
15	Knowledge graph / entity resolution layer	6	5	7	5	8	5/5	High	57/100	Defer

Rank	Feature initiative	Strategic fit	GTM leverage	DatIQ lead-gen use	Activation	Retention / monetization	Build effort	Risk / dependency	Priority score	Roadmap
16	Broad social-feed ingestion / LinkedIn scraping	6	8	7	6	7	5/5	Very high	55/100	Defer / API-led

The product-led approach supports this ranking: template galleries, integration pages, and use-case pages can be both acquisition assets and in-product activation mechanisms. Product-led B2B workflows work best when the product’s “aha” moment is instrumented and behavioral signals such as feature adoption, team invites, integrations, repeat sessions, and intent spikes are used for lifecycle nudges and sales-assist routing. [\[6\]](#) [\[7\]](#) [\[8\]](#) [\[9\]](#)

Why the Top Features Matter

1. Persona-Specific Template Gallery

What it is: A catalogue of ready-to-run, outcome-based workflows. A user clicks a template, supplies one URL/domain/list, and receives a defined business output.

Do not lead users with “Custom Extraction.” Lead them with:

- Build a sales-ready account brief
- Enrich a prospect list
- Monitor competitor pricing
- Create a competitor battlecard
- Audit a domain for SEO/GEO/AEO discoverability
- Research a vendor before a procurement conversation
- Build a local supplier list
- Extract customer proof from competitor websites
- Create a VC pre-meeting company brief

Why it has the highest strategic value:

- Repackages capabilities that DatIQ already owns into customer language.
- Makes landing pages, SEO pages, LinkedIn demonstrations, webinars, sales demos, and outreach offers much clearer.
- Shortens time to first value; users do not need to understand prompts, extraction schemas, or workflow design.
- Enables usage-based and plan-based feature gates without making the platform feel restricted.
- Gives you direct evidence on which job-to-be-done deserves deeper investment.

DatIQ self-GTM use: Every template becomes a marketing asset. For example, publish a “Competitor Pricing Tracker” page, demonstrate it through LinkedIn, offer a free three-competitor snapshot, and convert users into monitored-team accounts.

Conversion mechanism:

Landing page → Template import → First completed result → Export/share/monitor → Upgrade

Recommended initial templates:

Template	Persona	Why it converts	Primary paid trigger
Sales-ready Account Brief	Sales / SDR / AE	Immediate personalization value	Contact enrichment, exports, saved workspaces
Bulk ICP Account Enrichment	RevOps / Growth	Direct pipeline productivity	CSV limits, enrichment credits, CRM actions
Competitor Pricing Tracker	PM / PMM / E-commerce	Clear recurring business value	Monitored URLs, refresh frequency, alerts
Competitor Product & Messaging Monitor	Product / PMM	Better battlecards and positioning	Watchlist size, AI summaries, collaboration
SEO/GEO/AEO Audit	SEO / content	Clear reportable output	Domain/page limits, downloadable reports
Pre-Meeting Due Diligence Brief	VC / consultant / sales	Very low time-to-value	Batch processing, branded reports
Customer Proof Extractor	Sales / PMM	Feeds proof, messaging, and outbound	Bulk domains and scheduled updates
Lead List Builder for Indian SMBs	Agencies / procurement / growth	Uses IndiaMART/Justdial/MCA/Sulekha asset	List volume, verification, CRM export

Build first: 6 templates only. Avoid creating 30 templates before observing adoption.

2. Shareable Intelligence Reports

What it is: A clean, source-backed report generated from an extraction, account brief, competitor comparison, audit, or monitoring digest.

It needs:

- Unique but permission-controlled report URL
- Report title, data freshness timestamp, and source citations
- AI summary plus the underlying structured extraction
- Sections driven by template type
- “Duplicate / run on another company” call to action
- Export to PDF, Notion, Slack, HubSpot, Airtable, Google Sheets
- Free-tier DatIQ attribution; paid-tier removal of branding
- Workspace and access-control management

Why it is strategically important:

- Converts an internal output into a distribution loop.
- Lets DatIQ demonstrate trust through sources, timestamps, and evidence.
- Supports agency, consultant, VC, product, and sales use cases without building separate tools.
- Gives prospects a low-friction product preview through shared reports.

DatIQ self-GTM use:

- Send a prospect a custom “competitive snapshot of your category.”
- Publish gated or ungated benchmark reports built with DatIQ.
- Share product teardown posts on LinkedIn, linking to a live, source-backed mini-report.
- Use reports as lead magnets instead of generic PDFs.

Conversion mechanism:

- Recipient opens report → sees source-backed value → duplicates template → creates account → runs first extraction.
- Existing user shares report → colleague creates account → workspace invitation or paid-seat upgrade.

Critical metric: report-to-signup conversion, report shares per active workspace, and report recipients who run their own first workflow.

3. Account Intelligence and Bulk Enrichment

What it is: A workflow where users upload/import a list of company names or domains and receive validated, structured, scored account intelligence at scale.

Core workflow:

1. Import CSV, Google Sheet, Airtable view, HubSpot list, or manually pasted domains.
2. Normalize domain/company identity and deduplicate.
3. Crawl selected public sources/pages.
4. Execute configured extraction templates.
5. Generate enrichment fields and confidence/provenance.
6. Score ICP fit and explain the score.
7. Route outputs to CRM, Slack, sheets, Airtable, Notion, or exports.
8. Support repeat runs and delta enrichment.

Recommended first schema:

Category	Example fields
Identity	Company name, domain, canonical URL, HQ/location, description
Firmographics	Industry, sub-industry, employee-range estimate, geography
Commercial context	Products, target customer, pricing-page availability, pricing model
GTM signals	Customer stories, case studies, partner pages, new market messaging
People	Leadership contacts, title, source URL, confidence, public email where permissible
Technology	Tech stack/integrations/cloud indicators where extractable
Signals	Careers page, new job types, blog/changelog activity, recent announcements
Qualification	ICP score, why it scored, recommended persona, recommended outreach angle
Governance	Source URLs, extraction timestamp, confidence, consent/legal flags

Why it is DatIQ's most monetizable near-term feature:

- It aligns directly to Sales and RevOps budgets.
- The ROI narrative is simple: fewer hours of research, higher-quality outreach, less stale information.
- It makes credit-based pricing natural.
- It raises switching cost because lists, enrichment history, rules, and CRM fields become embedded in the customer workflow.
- It enables DatIQ's own prospecting at near-zero marginal research cost.

Important positioning: Do not say “we replace ZoomInfo.” Say:

“Use DatIQ to enrich the accounts you already have with live, source-backed intelligence from their public web presence.”

This avoids a difficult battle around massive proprietary contact databases and directs attention to DatIQ’s advantage: current, explainable, web-native research.

4. Competitor Watchlists and AI-Explained Diffs

What it is: A structured monitoring workspace for named competitors, discovered relevant pages, normalized data snapshots, field-level diffs, materiality filtering, and AI-generated implications.

Recommended v1 monitoring objects:

Signal type	Example detection	Business interpretation
Pricing	Price, plan, billing period, feature entitlement changed	Packaging, discounting, upmarket/downmarket move
Product	New product/module/integration/changelog item	Competitive gap or positioning response
Positioning	Homepage headline, ideal customer, vertical messaging changed	Target-segment shift
Customer proof	New case study, logo, industry, quantified outcome	Segment traction and sales-battlecard evidence
Hiring	New role family, leadership vacancy, geography	Growth, expansion, product investment, GTM push
Partnerships	New technology or channel partner	Ecosystem strategy change
Security / compliance	SOC 2, ISO, DPA, policy, terms-page update	Enterprise-readiness or vendor-risk indicator

The differentiator: Do not alert on every DOM change. Alert only when a **normalized business field** changes. Then explain why that change may matter.

Example output:

“Acme introduced a new ₹99,000/year Business tier, removed self-serve monthly billing from Pro, and added SSO to Enterprise. Interpretation: Acme appears to be moving toward larger accounts. Sales implication: lead with DatIQ’s faster self-serve evaluation for SMB/mid-market buyers; Product implication: assess whether SSO is now table stakes in enterprise deals.”

Why it supports conversion and retention:

- “Always-current” intelligence creates recurring reasons to use the product.
- Slack and email digests create re-engagement without asking users to return manually.
- Watchlist limits, monitoring frequency, AI analysis credits, and shared workspaces provide natural tier differentiation.
- It produces highly demonstrable value in sales calls and LinkedIn content.

5. Native Signal Routing and Rules

What it is: A lightweight action layer that converts detected intelligence into a defined workflow action.

Start with simple “if-this-then-that” rules rather than building an n8n competitor.

Examples:

Condition	Action
A monitored competitor changes a pricing field	Notify selected Slack channel and add a Notion battlecard update

Condition	Action
Account ICP score is 80+	Create/update HubSpot company and assign an owner
DatIQ identifies a leadership/contact candidate	Add to Airtable review table with confidence/source
A target account creates an enterprise sales job role	Add a “growth signal” property to HubSpot and notify SDR
Domain score drops due to a changed criterion	Add it to a requalification queue
SEO/GEO/AEO audit score is below threshold	Create an audit report and send it to the content owner
A new customer case study is published	Add evidence to a competitor proof repository

Why native rules matter even with Zapier:

Zapier is valuable for long-tail automation, but customers do not buy DatIQ because “it has a Zapier integration.” They buy it because a **relevant event is detected and the next action occurs automatically**. Native recipes make the product feel complete, while Zapier remains the extensibility layer.

Roadmap: Now, Next, Later

Now: 0–8 Weeks

The goal is to improve positioning, activation, and learning velocity—not to add broad technical surface area.

Initiative	Desired outcome	Why now
Six outcome-based templates	New users finish a meaningful workflow in first session	Reuses current capabilities
Guided onboarding by persona	Users select Sales, Product/PMM, SEO, VC/Research, Agency	Makes value proposition relevant immediately
Shareable intelligence reports v1	Every valuable output becomes distributable proof	Creates PLG/referral loop
PQL event tracking	Know who is likely to pay and why	Essential before scaling acquisition
Lifecycle email prompts	Drive users from extraction to export/monitor/invite	Low build effort, high conversion impact
Integration recipe gallery	Make existing Zapier/HubSpot/Slack/Notion/Airtable integrations usable	Converts integrations from checkbox to outcome
Free sample/credit funnel	Let visitors run one meaningful workflow	Creates evidence-led signup CTA

Now release theme:

“Get useful business intelligence from a URL—not raw extracted data.”

Next: 2–5 Months

The goal is to create recurring value and larger plan eligibility.

Initiative	Desired outcome	Primary persona
Bulk account intelligence v1	A list becomes an enriched, scored, actionable account table	Sales / RevOps
Competitor watchlist v1	Customers establish a recurring monitoring habit	Product / PMM
Field-level structured snapshots/diffs	Alert on material business changes rather than webpage noise	Product / Sales
Native Slack/HubSpot actions	Intelligence reaches the operating workflow	Sales / Product
Customer-proof extractor	Battlecards and sales outreach have current evidence	PMM / Sales
SEO/GEO/AEO report templates	Existing audit capability becomes a sellable workflow	SEO / agencies

Initiative	Desired outcome	Primary persona
Team workspaces, roles, shared assets	Make Team plan credible	All team personas

Next release theme:

“Turn web change into business action.”

Later: 6–12 Months

The goal is vertical expansion and deeper enterprise monetization after core usage patterns prove demand.

Initiative	Why later
Agency white-label and multi-client workspaces	Valuable but needs report/workspace maturity first
E-commerce pricing intelligence vertical	Strong revenue potential but requires pricing normalization and frequent monitoring reliability
Third-party enrichment waterfall	High customer value but cost, licensing, and dependency management are complex
Community/review intelligence	Differentiated but needs careful source/legal/policy strategy
Social-source ingestion	Social platform terms, API availability, and operational reliability make this a later strategic bet
Enterprise controls: SSO, SCIM, RBAC, audit export, retention controls	Build when paid opportunities require them
Entity resolution / knowledge graph	Technically heavy; should be driven by demonstrated cross-source need

Later release theme:

“Expand DatIQ from web intelligence into an intelligence operating system.”

GTM and Conversion Alignment

Acquisition → Activation → Monetization → Retention

Funnel stage	DatIQ product lever	Customer outcome	DatIQ metric
Acquisition	Persona landing pages, free report, free template, comparison pages	Prospect sees a defined job-to-be-done	Visitor-to-signup rate
First value	Guided template using their domain, competitor, or account list	First useful result in <5 minutes	Activation rate
Habit formation	Export, share, invite, schedule a monitor, connect Slack/HubSpot	Intelligence moves into team workflow	7-day active rate; integration adoption
Monetization	Bulk limits, monitored URL limits, alert frequency, team seats, branded reports	Customer hits a real scale/collaboration boundary	Trial-to-paid conversion
Expansion	More workspace seats, more monitored domains, automation volume, report branding	Broader business adoption	Net revenue retention
Advocacy	Shareable reports, referral credits, partner templates	User exposes DatIQ to a new audience	Invite/referral/report-recipient conversion

PLG should use the product experience as the demand-generation system: define a fast role-specific “aha” outcome, minimize first-use friction, instrument activation and depth of adoption, and use behavior to trigger contextual lifecycle or sales-assist actions. ^[7] ^[9] ^[10]

Recommended Activation Definitions

Do not use “a user extracted one URL” as activation. That creates a misleading vanity metric.

Persona	Activated when	Why it matters
Sales / SDR	Runs an Account Brief template, exports/routes it, and saves or monitors the account	They have produced actionable sales intelligence
RevOps	Uploads/imports at least 10 accounts, enriches them, and sends results to CRM/Sheet/Airtable	They have established a pipeline workflow
Product / PMM	Adds at least 3 competitors, monitors relevant pages, and shares/receives first digest	They have created a recurring intelligence loop
SEO / Content	Runs an audit and exports a content/optimization brief	They have created a production asset
VC / Analyst	Generates and shares/saves a company due-diligence brief	They have replaced a manual research task
Agency	Runs a client-branded report and connects an export destination	They can monetize it with clients

PQL Rules for DatIQ

A practical first PQL score can use product behavior plus account fit:

Signal	Suggested points
Used a persona template	+10
Completed two or more meaningful extractions	+10
Created a shareable report	+10
Connected HubSpot, Slack, Notion, Airtable, or Zapier	+20
Created a recurring monitor	+20
Imported/enriched 10+ companies	+20
Invited a teammate	+15
Visited pricing page twice within seven days	+10
Company is in ICP: B2B SaaS / relevant size / target geography	+15

PQL threshold: Start at 50 points. Above this, trigger a founder email offering help with their exact workflow—not a generic sales email.

Example:

“I noticed you ran competitor pricing checks across three domains and sent an output to Slack. If helpful, I can configure a weekly watchlist and a concise product-change digest for your team.”

That is contextual, useful, and aligned with their observed intent.

BRD: Product Build Considerations

Business Requirements Document

Product Name

DatIQ Intelligence Workflows

A modular product layer that turns URL extraction into repeatable, role-specific, action-oriented business intelligence.

Business Problem

Teams currently conduct web research across browser tabs, spreadsheets, manual notes, point monitoring tools, scraping tools, CRM databases, and workflow automation products. This creates five persistent failures:

- Research is slow and inconsistently structured.
- Data becomes stale immediately after collection.
- Raw extraction does not explain commercial relevance.
- Insights remain in individual documents rather than reaching CRM, Slack, Notion, or decision workflows.
- Generic tools require users to design their own workflows, schemas, and automation logic.

Business Objectives

Objective	90–180 day measurable target
Improve time-to-value	60%+ of new qualified signups complete a persona-specific first workflow
Improve paid conversion	Increase trial-to-paid conversion through value-based limits and workflow completion
Improve retention	Increase 30-day retention through monitors, digests, integrations, and team sharing
Raise ARPU	Establish credible Team and Business packaging around bulk, monitoring, automation, and seats
Lower CAC	Use templates and shareable reports as organic acquisition assets
Validate ICP	Identify whether Sales/RevOps or Product/PMM produces better activation, retention, and willingness to pay
Create enterprise pathway	Build provenance, permissions, monitoring history, and auditability incrementally

Primary Personas

Persona	Priority	Job-to-be-done	Success definition
Sales leader / SDR / AE	P0	Know a target account quickly enough to personalize and qualify outreach	Account brief usable before a call or sequence
RevOps / Growth	P0	Enrich and route account lists with current public intelligence	Better account scoring and less manual data preparation
Product Manager / PMM	P0	Stay informed about competitor pricing, products, positioning, and proof	Weekly actionable competitor digest
SEO / content strategist	P1	Turn site and competitor analysis into structured content work	Audit and brief ready for production
VC / analyst / consultant	P1	Compress pre-meeting and due-diligence research	Source-backed company report in minutes
Agency	P2	Deliver repeatable intelligence across clients	Branded, shared, recurring client reporting
Procurement / compliance	P3	Monitor suppliers and public policy/security changes	Auditable source snapshots and alerts

Success Metrics

Category	Metric
Acquisition	Visitor-to-signup by persona/use-case landing page
Activation	Percentage completing role-specific activation event
Product use	Template runs per active user; repeat workflows; reports shared
Workflow depth	Export rate; integration connection rate; monitor creation rate; teammate invitation rate
Revenue	Free-to-paid conversion; ARPA; credit/package attach rate; expansion revenue
Retention	Day-7, Day-30, and Day-90 active retention; monitor retention; logo churn
Efficiency	Cost per completed enrichment; extraction success rate; time to first result
Trust	Source attribution completeness; extraction confidence; alert false-positive rate

Non-Goals

For the immediate roadmap, do **not** build:

- A full CRM.
- A general-purpose workflow automation platform.
- A proprietary global contact database intended to compete with ZoomInfo/Apollo.
- Unrestricted LinkedIn/X scraping.
- A full legal/compliance management system.
- A complex knowledge graph before customers need cross-source entity resolution.
- Unlimited unmetered web crawling.

PRD: Feature Requirements

PRD 1 — Workflow Templates and Guided Onboarding

User Story

As a Sales user, I want to choose “Create an Account Brief,” enter a domain, and receive a research output that I can use in outreach without designing an extraction prompt or schema.

Functional Requirements

Requirement	Priority
Persona selection at onboarding: Sales, Product/PMM, SEO/Content, Research/VC, Agency	Must
Six launch templates with preconfigured extraction schema and output layout	Must
Template description: intended user, input, expected output, time estimate, required credits	Must
Single-domain and multi-domain input where applicable	Must
Editable fields/prompts for advanced users	Should
Save template run to workspace	Must
Duplicate and modify template	Should
Template-specific upgrade gates	Must

Requirement	Priority
Usage analytics per template	Must
Public template directory / share links	Should

Acceptance Criteria

- A new user can choose a template and complete a first workflow in fewer than five minutes.
- No prompt authoring is required for the default run.
- Every generated output has source URLs and an extraction timestamp.
- The app records template selection, run started, run completed, result viewed, export, share, monitor created, and upgrade click.
- A failed extraction provides a clear retry/edit/source-removal path.

Technical Considerations

- Store template definitions as versioned JSON/configuration, not hard-coded UI logic.
- Define `template`, `template_version`, `input_schema`, `extraction_schema`, `output_schema`, `plan_entitlement`, and `credit_cost`.
- Reuse existing extraction and enrichment functions.
- Maintain versioned prompts/extraction instructions so prior results remain reproducible.
- Use Supabase tables for runs, output objects, sources, template configuration, entitlement checks, and events.

PRD 2 — Shareable Intelligence Reports

User Story

As a Product Manager, I want to share a competitor analysis with my leadership team, with sources and a clear summary, without manually assembling a slide or document.

Functional Requirements

Requirement	Priority
Generate a report from a saved template run	Must
Private-by-default access model	Must
Share via secured link, organization-only link, or named collaborator	Must
Configurable expiry and revocation	Should
Report includes timestamp, source URLs, confidence/limitations, and structured fields	Must
Export to existing supported formats/destinations	Must
Free-tier DatIQ attribution and paid-tier branding controls	Should
Duplicate CTA for recipients	Must
Report engagement analytics	Should
Optional PDF generation	Later if not already supported

Security and Privacy Requirements

- Do not expose API keys, internal prompt metadata, workspace-only notes, hidden fields, or unauthorized contact data.
- Add robots/noindex behavior for private share pages.
- Support revocation immediately.
- Log report access where practical for paid/workspace tiers.
- Provide source/provenance fields, especially for contact and enrichment claims.

Acceptance Criteria

- An authorized user can generate a report in under 30 seconds after a completed extraction.
- Shared reports show explicit source provenance and the data-generated timestamp.
- Revoking a link blocks access immediately.
- Report recipient conversion is measurable.

PRD 3 — Bulk Account Intelligence

User Story

As a RevOps manager, I want to upload a list of company domains, enrich and score them using live website intelligence, review confidence and sources, then route approved accounts to HubSpot.

Functional Requirements

Requirement	Priority
Input: CSV upload, paste domains, Google Sheets, Airtable, HubSpot import	Must
Input mapping and validation	Must
Duplicate detection and canonical-domain normalization	Must
Select an enrichment template/schema	Must
Queue-based asynchronous processing with progress	Must
Per-row status: queued, running, complete, partial, failed, needs review	Must
Field-level source URL and timestamp	Must
Confidence score per field/row	Must
ICP scoring with explanation	Should
Filtering, sorting, saved views	Must
Export to CSV/Sheets/Airtable/Notion	Must
HubSpot create/update actions	Should
Credit estimation before job confirmation	Must
Usage cap and plan enforcement	Must
Re-run only stale/failed rows	Should
Human review queue for uncertain contacts/data	Should

Data Model Considerations

Suggested objects:

- lists
- list_records
- canonical_entities
- enrichment_jobs
- enrichment_job_items
- extracted_fields
- field_provenance
- confidence_scores
- icp_score_rules
- integration_actions
- credit_ledger
- monitoring_subscriptions

Non-Functional Requirements

Area	Requirement
Performance	Initial small-list target: 100 domains completed within an agreed asynchronous SLA, subject to crawling conditions
Reliability	Idempotent jobs; safe retries; per-domain error recording
Cost control	Cache source snapshots and reuse within a defined freshness window
Transparency	Show expected credits before run and actual credits after completion
Governance	Preserve sources/timestamps; do not present inferred data as verified fact
Rate limiting	Domain-level and account-level rate controls
Observability	Monitor extraction success, source failures, queue latency, cost/job, and integration failures

Commercial Requirements

- Free plan: limited account rows and no bulk export/integration.
- Pro: limited bulk batches and exports.
- Team: higher batch size, shared workspace, CRM/Slack routing.
- Business: scheduled re-enrichment, custom scoring, priority queues, advanced integrations.
- Credits must be tied to cost-bearing actions: crawl depth, number of fields, enrichment attempts, monitoring frequency, LLM analysis.

PRD 4 — Competitor Watchlists and Structured Change Intelligence

User Story

As a Product Manager, I want DatIQ to monitor competitors and tell me only the changes that matter—such as pricing, messaging, product, customer proof, or hiring—not every minor HTML modification.

Functional Requirements

Requirement	Priority
Create a named watchlist and add competitor domains	Must
Domain mapping to recommend relevant pages	Must
User chooses monitored categories/pages	Must
Scheduled crawling at plan-defined frequency	Must
Structured snapshot of configured fields	Must
Field-level comparison against previous snapshot	Must
Materiality rules and noise suppression	Must
AI explanation with explicit evidence	Must
Slack/email digest delivery	Must
Notion/Airtable/HubSpot routing	Should
Per-change acknowledgment, archive, mute, and feedback	Should
Weekly/monthly digest	Must
Historical change timeline	Should
Competitor-to-competitor comparison view	Later

Materiality Model

A change should be classified as:

Class	Example	Default action
Critical	Pricing increase, plan removal, major product launch, legal/security change	Immediate alert
High	New vertical, key partnership, new enterprise feature, senior leadership role	Daily digest/alert
Medium	New customer story, integration, content positioning shift	Weekly digest
Low	Copy edit, minor page redesign, date change	Store but do not alert
Unknown	Extraction confidence low or ambiguous content	Send to review queue or suppress

Quality Requirements

- Alert precision matters more than alert volume.
- Users must see old value, new value, source URL, detection time, and AI explanation.
- AI explanation must distinguish **fact** from **interpretation**.
- Provide user feedback controls: “useful,” “not useful,” “mute this field,” and “increase/decrease sensitivity.”
- Measure false-positive rate and alert-to-action rate.

PRD 5 — Native Signal Routing

User Story

As a Sales Operations user, I want a high-fit account or significant competitor change to automatically trigger the next action in the tools my team already uses.

Functional Requirements

Requirement	Priority
Create rule from a supported signal	Must
Conditions based on field, score, change type, source, confidence, and schedule	Must
Native actions: Slack message, email via Resend, webhook, HubSpot create/update/task	Must
Existing Zapier handoff for long-tail destinations	Must
Test rule with sample payload	Must
Action execution history and error status	Must
Retry failed actions	Must
Per-workspace access control	Must
Rule templates by persona	Should
Multi-step conditional branching	Later
Visual workflow builder	Defer

Example Rule Definition

```
{
  "name": "Alert on competitor pricing change",
  "trigger": {
    "type": "structured_field_changed",
    "template": "competitor_pricing_tracker",
    "field": "pricing.tiers"
  },
  "conditions": [
    {
      "field": "change.materiality",
      "operator": "in",
      "value": ["critical", "high"]
    },
    {
      "field": "confidence",
      "operator": "gte",
      "value": 0.8
    }
  ],
  "action": {
    "type": "slack_message",
    "destination": "product-competitive-intel",
    "format": "competitor_change_summary"
  }
}
```

Build an internal canonical event model before expanding integrations. For example:

- extraction.completed
- enrichment.completed

- `enrichment.failed`
- `account.score_changed`
- `monitor.change_detected`
- `monitor.digest_ready`
- `report.shared`
- `report.viewed`
- `integration.action_failed`
- `usage.limit_approaching`

That event model will make future integrations and internal lifecycle automation much cheaper to build.

Product Architecture and Governance Considerations

Architecture Direction

Layer	Recommendation
User interface	Retain React/Vite. Add template-driven workflow screens, tables, monitoring workspace, and report pages incrementally
Application/API	Continue serverless functions for orchestration; isolate long-running crawl/enrichment workloads through a durable job/queue approach
Data	Extend Supabase with normalized entities, source snapshots, extracted fields, provenance, event logs, monitors, rule definitions, and credit ledger
Extraction	Keep reusable extraction modules independent of UI/template; version prompts and schemas
Scheduling	Separate schedule definitions from monitored object state; support retries/backoff and concurrency limits
AI	Use model outputs only after structured evidence collection; store model/version/prompt references for traceability
Integrations	Build native high-frequency actions; retain Zapier/webhooks for the long tail
Billing	Use existing Razorpay/Stripe plan/credit foundation; meter expensive operations accurately
Analytics	Capture full product funnel and account-level usage; create a founder dashboard before scaling channels

Data Provenance Is a Product Feature

For DatIQ, provenance should not be buried in metadata. It is necessary for trust and enterprise readiness.

Every important output should disclose:

- Original source URL
- Crawl/extraction timestamp
- Extraction method/version
- Confidence score
- Whether a field was explicitly observed, inferred, or generated by AI
- Prior value and current value for monitored changes
- User/workspace that initiated a run where appropriate

This protects product credibility when fields are wrong or stale and becomes a differentiator versus opaque enrichment databases.

Compliance Boundaries

For initial product scope:

- Focus on publicly accessible web information.
- Respect source terms, robots directives where applicable, rate limits, and user-provided lawful access.
- Avoid building features positioned as unrestricted social-network scraping.
- Treat personal contact data as sensitive: source it transparently, label confidence, provide removal/correction pathways, and ensure lawful-use guidance.
- Build organization-level deletion/export controls before selling compliance-heavy use cases.
- Retain raw snapshots only for a documented period, with customer-configurable retention later.

Commercial Packaging Alignment

Plan	Primary buyer	Included outcome	Primary limits / upgrade trigger
Free	Individual evaluator	A few single-URL extractions and one guided template	More runs, saved history, exports
Pro	Individual seller, PM, consultant	Account briefs, simple reports, limited monitors	Number of domains, report branding, scheduled jobs
Team	Sales team, Product/PMM team, agency	Bulk lists, shared reports, competitor watchlists, integrations	Seats, batch size, monitored URLs, Slack/HubSpot actions
Business	RevOps, product org, larger agency	ICP scoring, recurring digests, custom templates/rules, priority processing	Automation volume, governance, audit history
Enterprise	Larger organizations	SSO/RBAC, advanced audit/compliance, custom sources/integrations, support	Contracted usage, security terms, support SLA

The pricing unit should be legible:

- **Extraction credits** for cost-bearing research/enrichment.
- **Monitored URLs or watchlist units** for recurring tracking.
- **Seats/workspaces** for collaboration.
- **Automation runs/actions** for integrations and signal routing.
- **Report branding/governance** for agency and enterprise tiers.

Avoid a confusing model where every click costs credits. Make the cost visible before a batch run, distinguish included usage from overage, and tie upgrades to outcomes customers recognize.

The Recommended Build Order

Build First

1. Workflow templates and role-based onboarding
2. Shareable, source-backed reports
3. Product analytics, activation definitions, and PQL/lifecycle triggers
4. Integration recipe gallery using integrations already available
5. Bulk Account Intelligence v1
6. Competitor Watchlist v1 with normalized pricing/product/positioning fields
7. Slack/HubSpot native action rules

Validate Before Expanding

- Which template gets the highest completion rate?
- Which persona has the best 30-day retained usage?
- Does bulk enrichment generate paid conversion or only free usage?
- Do monitored watchlists reduce churn and increase usage frequency?
- Which integration is actually connected and acted upon?
- What is the customer's willingness to pay per batch, per monitored URL, and per team workspace?

Explicitly Defer

- Full social scraping.
- Community intelligence at scale.
- Third-party waterfall enrichment with multiple paid providers.
- Deep enterprise compliance features.
- Knowledge graph/entity resolution.
- Complex visual workflow builder.
- Full white-label multi-client operations.

Decision Framework

Use this rule for each proposed feature:

Ship it only if it improves at least two of the following: acquisition, first-session activation, recurring usage, team collaboration, paid conversion, expansion, or DatIQ's own ability to generate qualified demand.

By that test:

- **Templates** improve acquisition, activation, conversion, and positioning.
- **Shareable reports** improve acquisition, collaboration, and conversion.
- **Bulk account intelligence** improves lead generation, monetization, and retention.
- **Competitor watchlists** improve positioning, retention, and ARPU.
- **Native signal routing** improves usability, retention, and expansion.

That is why these are the right expansion features for DatIQ now: they are not disconnected “nice-to-have” capabilities. Together they form one coherent product loop:

URL/list input → structured intelligence → business interpretation → workflow action → recurring monitoring

This loop strengthens DatIQ's GTM, generates leads for DatIQ itself, raises customer conversion, and creates the recurring usage needed for a durable B2B SaaS business.
