

DatIQ — Fresh Market & Product Analysis

datiq.app · July 2026 review

Intelligence from every URL — a no-code URL-to-structured-data + AI-enrichment platform.

This analysis was produced fresh on 16 July 2026 by re-reading the live site and refreshing the competitive landscape. Capabilities visible only on marketing/pricing pages (and not transaction-tested) are labelled "**publicly listed**" rather than confirmed-working.

1. Executive summary

DatIQ's public site now presents a markedly more complete product than at the June 2026 audit. The most damaging gaps from that review — **payments in "Demo mode"**, the **incomplete ScrapeLite rebrand**, and **no batch/scheduling/CRM story** — now appear addressed. Pricing is Razorpay-powered with INR+GST and USD tiers, annual billing at ~20% off, a new **Developer** tier (\$39/mo, API + JSONL/RAG export) and **Enterprise** tier (≥\$1,000/mo, SSO/SAML, DPA, SLA, on-prem). The product surface has grown from "one URL at a time" to include batch mode (5–500 URLs), scheduled monitoring, Google Sheets / HubSpot / Salesforce / Slack routing, white-label PDF, and four outcome-based use-case workflows ([datiq.app](#), [pricing](#), [use-cases](#)). Public positioning is no longer "pre-revenue," though checkout was not transaction-tested.

The central question — does the single-URL Home Screen make sense? Yes, but only as the *front door*, not the *whole house*. It is the correct low-friction demo and a strong PLG hook (Thunderbit, Firecrawl and [Browse.ai](#) all use the same pattern because it converts). But most revenue-generating jobs are **batch, not one-off**: SDRs research 50 prospects, CI analysts track 8–15 competitors, agencies deliver 20 reports/week. A homepage that only shows one URL silently tells those buyers "this is a toy."

Recommended headline move: keep the single-URL hero as the magic demo, but upgrade it to a single smart input that auto-detects one URL, many URLs, a whole domain, or a CSV paste — and sit it above 4–6 outcome tiles ("Research a company", "Compare competitors", "Build a lead list", "Brief me for a meeting"). This is the single highest-leverage UX change and the top quick win.

Strategic positioning: DatIQ is wedged between Thunderbit (cheaper, browser-native) and [Browse.ai](#) (more monitoring volume) from below, and Clay (\$167–495/mo GTM orchestration) / Firecrawl (\$16–599 LLM-ready API) from above. Its realistic moat is **not** the scraping primitive (Firecrawl + Claude + React is reproducible in a weekend) but **vertical workflows + India-localization + a managed-data/provenance layer**.

2. What changed since the June 2026 audit

June 2026 gap	July 2026 status (publicly listed)
Payments simulated ("Demo mode")	Pricing now "Powered by Razorpay" ; INR incl. 18% GST, USD ex-tax; checkout not transaction-tested (pricing)
No annual plan	Annual billing at ~20% off, billed upfront, across paid tiers
No INR / UPI path	INR + GST shown; UPI Autopay not explicitly confirmed
No batch mode	Batch mode present, 5 (Free) → 10 → 25 → 200 → 500 (Agency) URLs
No scheduling/monitoring	Scheduled monitoring included; add-on \$5/URL/mo
No CRM push	HubSpot / Salesforce on Business tier; Google Sheets push on Pro; Slack routing on Agency
API undocumented / \$199-only	Dedicated Developer tier (\$39/mo, 10K row-credits, API-first, webhook, JSONL/RAG export)
No RAG export	JSONL / RAG export on Developer tier
No enterprise story	Enterprise tier (≥\$1,000/mo): SSO/SAML, DPA & SLA, on-prem option, dedicated SE
Feature-led landing	Four outcome use-cases now published (Lead-gen, Competitor, SEO, Domain-mapping)
Dead /compare pages, "ScrapeLite HELP" tab	Comparison pages no longer surfaced in nav; rebrand appears cleaned up on visible pages

Read: the founder has executed against most of the prior audit's "fire-drial" list. The product now reads as a credible v2 SaaS rather than a pre-revenue MVP. The remaining work is **engagement, workflow depth, and defensibility** — not table-stakes fixes.

3. Current product readout (modules & screens)

Surface	What's there (publicly listed)
Home /	Hero "Intelligence from Every URL", paste-URL try-it widget, 4 toggles (JS render, domain map, contacts, custom), 8 feature cards, 3 testimonials, stats ("11+ teams, 138+ extractions, 30s avg, 7 export & enrichment types")
Extract / Preview /preview	URL identity card, AI summary, one-click enrichments (Contacts, Leadership, Socials, Mission, Pricing), tabbed results, Save-to-Dashboard
Dashboard /dashboard	Table/card view, per-row CSV/PDF export, multi-select, "Generate" + "Send email" actions
Pricing /pricing	7 tiers (Free / Select / Pro / Business / Agency / Developer / Enterprise) + 3 add-ons, Razorpay
Use-cases /use-cases	4 workflow pages: Lead-gen, Competitor monitoring, SEO auditing, Domain mapping
Auth	Google, Microsoft, GitHub OAuth + email/password
Blog	Articles (one historically leaked the stack: Firecrawl extraction + Anthropic enrichment + Supabase)

Feature inventory by layer

- **Extraction:** headings (H1–H6), every link (deduped), AI summary, custom plain-English field extraction, domain mapping, JS-render toggle.
- **Enrichment:** contacts & leadership emails, socials, mission, pricing tiers, AI content generation (SEO outlines/briefs).
- **Export/sync:** CSV, PDF, Markdown, JSON, Email, webhook/n8n, Google Sheets, HubSpot, Salesforce, Slack, white-label PDF, JSONL/RAG.
- **Automation:** scheduled monitors (change alerts), batch mode, CSV import enrichment.
- **Billing/admin:** 7-tier ladder, top-ups, multi-currency, annual billing, white-label, multi-workspace (Agency).

4. Home Screen single-URL assessment

Where it works

- **Fastest possible aha-moment** — paste one URL, see magic in 30s. This is the proven PLG conversion pattern for the category.
- **Low cognitive load** — no schema, no list management; matches the "zero-code" positioning.
- **Mobile-friendly** — pasting one URL works on a phone; pasting 50 doesn't.
- **Ad-hoc high-frequency jobs** — VC analyst pre-call, SDR researching one account, PM checking one pricing page.

Where it hurts

- **Silently signals "toy"** to batch buyers (SDRs, CI analysts, agencies) who drive real revenue.
- **No path to a "home" inside the product** — logged-in users land back on the marketing hero instead of a Projects/Lists workspace, hurting day-2 retention.
- **No credit transparency before a run** — bill-shock anxiety is a top 2026 buyer expectation.
- **Single input can't express intent** — it can't say "compare these 5 competitors" or "brief me before this meeting."

Verdict

The single-URL hero is a good **try-it hook** but a weak **daily-driver surface**. Keep it as the demo; build a batch path that is equally visible; and layer outcome tiles that sell jobs-to-be-done rather than features. (This mirrors how [Browse.ai](#)/[Apify](#) split anonymous demo vs logged-in workspace.)

How it should drive inclusions & engagement

1. **One smart input** that auto-detects: single URL → card; 2+ URLs → batch table; root domain → map; CSV paste → bulk grid. Progressive disclosure — novices see one box, power users discover batch by pasting more lines.

2. **Outcome tiles above the box** ("Research a company", "Compare competitors", "Build a lead list", "Audit a website's SEO", "Monitor pricing changes", "Brief me before a meeting") — each pre-wires the right enrichment combo. This is exactly how Clay sells "Outbound / Inbound / CRM Enrichment" and supports \$167+/mo entry.
3. **Pre-flight credit estimate** ("This will use 5 of your 10 free extractions") — kills bill-shock, a top 2026 SaaS buyer expectation.
4. **Save-as-Project/List** — gives users a reason to return and seeds the monitoring upsell.
5. **Logged-in landing = Projects workspace**, not marketing home — fixes day-2 retention.

5. Market landscape & alternatives

The category

Industry estimates put the web-scraping market at roughly **\$1.0B (2025) growing toward ~\$2B by 2030** and the broader data-extraction market at **~\$6B growing toward ~\$24B by 2034**; competitive-intelligence tools are among the faster-growing adjacent segments (commonly cited ~21% CAGR). These figures are third-party estimates and should be re-verified before use in board materials. CB Insights groups DatIQ-adjacent vendors (Apify, Zyte, Diffbot, Kadoa, Oxylabs, ScrapingBee, Import.io) under its **"web scraping services"** market map, framed as feeding competitive intel, pricing, and product signals (CB Insights — AI training data market map).

Direct & adjacent competitors

Competitor	Entry price	What they sell	DatIQ's relative position
<u>Browse.ai</u>	Free → \$19–69 (annual) → \$500+	Robot-based scheduled monitoring, 250+ prebuilt robots, change detection	DatIQ simpler (paste-URL) but <u>Browse.ai</u> gives far more monitoring volume/dollar
Clay	Free → \$167 → \$446–495 → Enterprise	GTM orchestration, 150+ data providers, waterfalls, CRM sync, Audiences	DatIQ 10× cheaper at entry but lacks data marketplace; Clay hit ~\$150M ARR (<u>Sacra</u>)
Firecrawl	Free → \$16 → \$83 → \$333 → \$599 → Enterprise	LLM-ready scraping API (DatIQ's own infra); /monitor, /extract, /interact, MCP	DatIQ resells Firecrawl via a UI — thin moat; Firecrawl's /monitor cuts up to 90% LLM tokens
Thunderbit	Free → \$9 → \$16.5	2-click Chrome AI scraper, AI-suggest-fields, subpage scraping	DatIQ has no extension — Thunderbit owns in-page UX, the lowest-friction acquisition channel
Bardeen	Free → \$10 → \$50 → Enterprise	Browser-native GTM automation, playbooks, AI agents, enrichment	DatIQ lacks browser-native automation & agent mode
Apify	Free → \$29 → \$199 → \$999	Marketplace of 6,000+ Actors, compute-unit billing	DatIQ has no marketplace / developer ecosystem
PhantomBuster	\$69 → \$159 → \$439	150+ Phantoms, LinkedIn focus	DatIQ has no LinkedIn-native automation
Diffbot	Free → \$299 → \$899 → custom	Knowledge Graph + AI extraction, entity resolution	DatIQ cheaper but no graph/entity resolution

Competitor	Entry price	What they sell	DatIQ's relative position
Prisync	Trial → SMB	E-commerce competitor price monitoring + dynamic repricing	DatIQ's pricing extraction is a feature, not a workflow
Klue / Crayon / Kompyte	Enterprise (\$\$\$)	Competitive intelligence platforms (battle cards, sales enablement)	DatIQ far cheaper but lacks CI workflow (battle cards, digest, sales alerts)

Adjacent substitutes (not scrapers, but competing for the same "research job")

- **Perplexity / ChatGPT Deep Research / Google NotebookLM** — answer the "summarize/research this" job conversationally; a user may never need structured fields.
- **AlphaSense / Semrush / Similarweb** — market & competitive intelligence with curated datasets (vs DatIQ's "any URL" extraction).
- **DIY: Google Sheets + Zapier/n8n + an API** — the default free alternative every technical buyer compares against.

Strategic read: DatIQ is wedged between Thunderbit (cheaper, browser-native, more polished) and [Browse.ai](#) (more monitoring volume) from below, and Clay/Firecrawl from above. It has **no defensible moat** today on the scraping primitive. Moats in this category are owned by ecosystem players — Clay's data marketplace, Apify's actor store, Thunderbit's browser-native UX, [Browse.ai](#)'s monitor scale. DatIQ's path is to **out-verticalize and out-localize**, not out-feature.

6. Competitor-inspired features worth borrowing

These are competitor features that would materially enrich DatIQ's value to different customer types. Cross-pollinated, not copied wholesale.

Feature (origin)	Why it adds value	DatIQ fit
AI-suggest-fields (Thunderbit)	Removes blank-prompt paralysis; AI proposes columns from the page	Strong — aligns with "plain-English extraction" core
Prebuilt template/robot library (Browse.ai 250+, Apify 6,000)	Onboarding in seconds; SEO long-tail ("extract pricing from [site]")	Strong — currently users face a blank prompt
Chrome extension (Thunderbit, Bardeen, Clay)	Lowest-friction acquisition + in-context extraction on any page	High value; biggest missing channel
Change-diff visualization (Browse.ai , Firecrawl /monitor)	Before/after views, severity, historical timeline — not just email alerts	Strong upsell on monitoring
Waterfall enrichment (Clay, Bardeen)	Try multiple data sources sequentially for best email/phone match	Medium — needs data-provider partnerships
Natural-language playbook/agent (Bardeen Magic Box, Firecrawl FIRE-1)	"Tell me what to research" → agent runs it; matches agentic-UI trend	Strategic differentiator (aligns with user's RAG/multi-agent interests)
Sheet-as-UI (Clay)	URLs in column 1, enrichments across columns; the sticky up-market UX	Strategic endgame for Agency tier

Feature (origin)	Why it adds value	DatIQ fit
Adaptive scraping (Bardeen auto-adjusts to DOM changes)	Reduces silent failures from site changes	Medium — reliability win
Dynamic repricing rules (Prisync)	Turn pricing extraction into action, not just data	Vertical SKU opportunity
Battle cards / CI digest (Klue, Crayon)	Turn raw competitor data into sales-enablement output	Vertical SKU for sales teams
Pay-per-success billing (Clay 2026, Web Scraper API)	Credits only consumed on successful retrieval — major trust signal	Strong pricing-trust move
Keyless MCP / agent integration (Firecrawl)	Agents call DatIQ with zero key setup	Aligns with Developer/RAG tier
Public sample gallery / shareable reports (Browse.ai , Thunderbit templates)	PLG loop + SEO + social proof	Low effort, high leverage

7. Product differentiation opportunities

Given DatIQ's stack (Firecrawl + Claude + Supabase), geography (India-built), and price point, the defensible wedges are:

1. **B2B SaaS Pricing Intelligence** — vertical SKU monitoring competitor pricing pages, surfacing tier changes, posting to Slack. Underserved between Prisync (e-commerce only) and Klue/Crayon (enterprise). \$99–299/mo.
2. **India-first GTM research** — INR pricing, UPI Autopay, DPDP-compliant data residency (AWS Mumbai), Hindi-language summaries, IndiaMART/JustDial/MCA connectors. No global incumbent owns this.
3. **Investor / VC due-diligence pack** — one-click "DD Brief" PDF from a company URL (team, pricing, stack, news, hiring). Productize the existing VC testimonial at \$49/report or \$199/mo.
4. **Agency white-label research** — branded PDFs, multi-client workspaces, scheduled deliveries. \$299–499/mo with per-client seats.
5. **RAG-ready corpus builder** — export to JSONL with embeddings + chunking metadata. Differentiated developer wedge vs Firecrawl.
6. **Provenance/confidence layer** — every extracted field carries source URL, confidence score, last-checked timestamp, raw evidence snippet. Builds trust vs raw-HTML tools and is rare in the category.

8. Prioritization framework

Formula

$$\text{Priority} = \frac{\text{Benefit} \times \text{Feasibility}}{5}$$

where

$$\text{Benefit} = 0.30 U + 0.25 En + 0.20 R + 0.15 D + 0.10 M$$

$$\text{Feasibility} = 0.70 \text{Ease} + 0.30 \text{Safety}$$

Each variable scored 1–5, with **higher = better/easier/safer** (so 5 = most useful / most engaging / easiest to build / lowest risk). Multiplying Benefit by Feasibility rewards high-value, low-effort items; dividing by 5 keeps the scale comparable to the input axes (max ≈ 5.0).

Benefit components (weights sum to 1.0):

- **U – Usefulness** (0.30): how much it solves a real, frequent job.
- **En – Engagement** (0.25): day-2 retention, habit-formation, return-visit pull.
- **R – Revenue/Effectiveness** (0.20): direct monetization or conversion impact.
- **D – Differentiation** (0.15): moat vs [Browse.ai/Clay/Firecrawl/Thunderbit](#).
- **M – Market pull** (0.10): demand signal / competitive parity pressure.

Feasibility components (weights sum to 1.0):

- **Ease** (0.70): build effort (5 = trivial, 1 = multi-month).
- **Safety** (0.30): technical/compliance/maintenance risk (5 = low risk, 1 = high risk).

Using Ease/Safety as a **multiplier** (not a denominator, and not inverted) keeps the semantics intuitive and prevents the trap where "5 = easy" accidentally penalizes easy items. A trivial high-value item (e.g. credit estimator, analytics) naturally floats to the top; a strategic but heavy item (agentic interface) ranks by true ROI.

Planning horizons:

- **Quick wins** — 0–30 days, low/medium effort, conversion/activation.
- **Growth bets** — 30–90 days, retention/workflow depth.
- **Strategic moat** — 3–12 months, differentiation/enterprise unlock.

Scores are **illustrative guides** from the formula — recalibrate Ease/Safety after engineering scoping. Items within ~ 0.05 of each other are effectively tied; sequence by dependency, not score.

9. Prioritized backlog

9.1 Quick wins (0–30 days)

#	Enhancement	U	En	R	D	M	Ease	Safety	Score
Q2	Pre-flight credit estimator before every run	4	4	5	3	5	5	5	4.15
Q11	Product-analytics instrumentation (activation funnel, cohort retention, success-extraction rate, save/export/monitor conversion, time-to-first-insight)	4	5	4	3	4	5	5	4.10
Q7	Batch default = table view for multi-URL (comparable grid)	5	4	3	3	4	5	5	3.95
Q1	Smart multi-input Home — auto-detect single/multi-URL/domain/CSV in one box	5	5	4	3	5	4	5	3.87
Q3	Outcome tiles above hero (6 jobs-to-be-done, pre-wired enrichments)	5	5	4	3	4	4	5	3.78
Q5	Template/example library (10–15 prebuilt extractions)	5	4	4	3	5	4	5	3.66
Q4	Logged-in → Projects/Lists workspace (not marketing home)	4	5	4	3	4	4	5	3.53
Q6	Shareable report links + public sample gallery (PLG loop + SEO)	4	4	4	3	5	4	5	3.40
Q8	Verify "claimed vs working" — test checkout, batch, CRM push, API live	5	3	5	2	4	4	5	3.40
Q10	Annual-billing default toggle on pricing (Browse.ai forcing function)	3	3	5	2	4	5	5	3.35
Q9	Provenance on every field (source URL, confidence, last-checked)	5	3	4	5	3	3	4	2.71

9.2 Growth bets (30–90 days)

#	Enhancement	U	En	R	D	M	Ease	Safety	Score
G3	Integration recipes hub (Sheets/HubSpot/Slack/n8n/Notion how-tos)	4	4	4	3	5	4	5	3.40
G4	AI-suggest-fields in custom extraction (no blank-prompt paralysis)	5	4	3	3	4	4	4	3.16
G1	Change-diff visualization (before/after, severity, timeline) on monitors	5	5	4	4	4	3	4	3.00
G6	Referral / affiliate + credits PLG loop	3	4	5	3	4	4	4	3.00
G2	Chrome extension (in-context extraction, AI-suggest-fields)	5	5	4	4	5	3	3	2.79

#	Enhancement	U	En	R	D	M	Ease	Safety	Score
G5	CSV-import-as-grid bulk extraction (URLs col 1, enrichments across cols)	5	4	4	3	4	3	4	2.74
G7	INR India SKU (₹ tiers, UPI Autopay, Hindi UI, AWS Mumbai residency, DPDP posture)	4	3	5	5	4	3	3	2.46
G9	Email verification + dedupe on contacts (parity with Apollo/Clay)	4	3	4	2	4	3	3	2.07
G8	Anti-bot resilience tier (residential proxies, CAPTCHA solve, fallback engine beyond Firecrawl)	4	3	4	4	4	2	2	1.50

9.3 Strategic moat (3–12 months)

#	Enhancement	U	En	R	D	M	Ease	Safety	Score
S4	Investor / VC DD-Brief product (one-click PDF, \$49/report)	4	4	5	4	4	3	4	2.77
S5	RAG-ready corpus builder (JSONL + embeddings + chunking; deepen Developer tier)	4	4	4	5	4	3	3	2.49
S9	Public API + keyless MCP server for agent frameworks	4	3	4	4	4	3	3	2.25
S2	Agentic / conversational front door ("tell me what to research" → agent runs)	5	5	4	5	5	2	3	2.21
S1	Vertical SKU: B2B SaaS Pricing Intelligence (monitor + Slack alerts + quarterly index lead magnet)	5	4	5	5	5	2	3	2.19
S3	Sheet-as-UI (Clay-style grid) for Agency tier	5	5	4	4	4	2	3	2.09
S6	Waterfall enrichment (multi-provider email/phone)	4	3	4	4	4	2	3	1.73
S8	CI battle-card / digest output (Klue/Crayon-style sales enablement)	4	3	4	4	3	2	3	1.68
S7	SOC 2 Type 1 + DPA + sub-processor page + India/EU residency	3	2	5	4	4	2	3	1.56

Note on S1 vs higher-scoring strategic items: S4, S5, S9 score higher on raw ROI because they are lighter, but S1 carries the top **Differentiation + Market-pull profile (D5/M5)**. For a *moat* decision (not a sprint decision), differentiation weight should override ease — so S1 remains the recommended first vertical SKU even though faster strategic wins rank above it on the composite score.

10. Recommended sequencing

Sprint 1 (0–30 days) — Make the Home Screen earn its keep.

Q2 credit estimator → Q11 analytics instrumentation → Q1 smart multi-input → Q3 outcome tiles → Q7 batch-table default → Q4 logged-in workspace → Q5 templates. These compound: the demo becomes a daily driver and the activation-to-paid funnel widens. Run Q8 (verify claimed features actually work, including checkout) in parallel — credibility depends on it.

Sprint 2 (30–90 days) — Depth & acquisition.

G3 integration recipes → G4 AI-suggest-fields → G1 change-diff view → G6 referral loop → G5 CSV-grid → G7 India SKU → G2 Chrome extension. G8 anti-bot and G9 email verification are reliability/parity prerequisites for the vertical SKU.

Sprint 3 (3–12 months) — Pick one moat and build around it.

Recommended: S1 B2B SaaS Pricing Intelligence as the first vertical SKU (cleanest whitespace under \$500/mo), feeding S4 VC DD-Brief and S8 CI digest as adjacent productized outputs. Layer S2 agentic front door and S3 sheet-UI as the up-market UX bet. S7 SOC2/DPA unlocks mid-market; S5 RAG builder deepens the Developer tier; S9 keyless MCP seeds the agent ecosystem.

11. Engagement levers (what drives return visits)

- **Saved Projects/Lists + scheduled monitors** → recurring touchpoints (the monitoring upsell is the retention engine [Browse.ai](#) built on).
- **Shareable report links + public gallery** → virality + SEO + social proof (PLG loop).
- **Transparent credit metering** → trust → willingness to upgrade (Clay's 2026 move to pay-per-success is the bar).
- **Outcome tiles that A/B test which "job" converts best** → double down on the winning vertical.
- **Templates library** → reduces blank-canvas churn in week 1.
- **Referral credits** → solo-founder SaaS in this category lives or dies on PLG loops.
- **Agentic "brief me" flows** → high-frequency pre-meeting/pre-call usage (VC analysts, SDRs).

Evidence base for the engagement design: persona- and journey-mapped onboarding (not one-size-fits-all) and cohort-based retention analytics are what separate product-led organizations from feature-led ones ([Wiley — The Product-Led Organization, Olson](#)); dashboards succeed when placed at the natural point of the user's workflow rather than behind a separate login ([Wiley — Project Management Metrics, KPIs, and Dashboards, Kerzner](#)). Academic work reinforces the mechanics: cognitive-load management and adaptive, user-centred design improve task performance and retention in information systems ([Suryani et al., IEEE Access 2024](#)); automated persona identification and next-service recommendation on information-dense pages helps users reach their goals sooner ([Tabari et al., 2023](#)); and a user's probability of returning to an app is well-modelled by a small set of retention parameters — i.e. repeat-return is a designable metric, not luck ([Kloumann et al., WWW 2015](#)). Structured onboarding for new digital tools measurably improves first-use success ([Stoiber et al., 2022](#)).

12. Risks, assumptions & caveats

- **"Live" payments:** the pricing page is "Powered by Razorpay," but checkout was not transaction-tested. Confirm a real upgrade flows through before any paid-acquisition spend.
- **Claimed vs working:** batch, monitors, CRM push, Slack routing, API, JSONL/RAG export are publicly listed on pricing/use-case pages but were not authenticated-flow-tested. Verify before promoting them externally.
- **Firecrawl dependency:** the entire extraction layer is a single vendor; Firecrawl outage = DatIQ outage, and Firecrawl's stealth/anti-bot mode now costs 5× credits and fails on protected sites. A fallback engine is a medium-term risk.
- **Moat thinness:** Firecrawl + Claude + a React UI is reproducible in a weekend. Differentiation must come from vertical workflows, India-localization, and the provenance/managed-data layer.
- **Social proof still thin:** "11+ teams, 138+ extractions" is honest but early; the trust gap to [Browse.ai](#) (300,000+ users) and Clay (~\$150M ARR) is large.
- **Market-size figures in \$5** are third-party estimates, not freshly verified — re-confirm before board/investor use.

13. Bottom line

DatIQ's public site now presents a credible v2 SaaS rather than a pre-revenue MVP — the table-stakes fixes (payments, batch, scheduling, CRM, Developer & Enterprise tiers) appear addressed, and the remaining work is the harder, more valuable problem: **converting a good scraping tool into a daily-driver workflow product with a moat**. The single-URL Home Screen should stay as the magic demo but be upgraded to a smart multi-input with outcome tiles and a logged-in Projects workspace. The defensible bets are one vertical SKU (B2B SaaS Pricing Intelligence), India-localization, a Chrome extension for acquisition, and a provenance/confidence layer for trust. Sequence the quick wins first — they compound and fund the moat.
