

DatIQ — Market, Product & Competitive Analysis with Prioritised Enhancement Roadmap (July 2026)

Executive Summary

DatIQ (datiq.app) is a no-code, AI-powered URL intelligence platform that lets users paste any web URL and instantly receive structured insights: heading outlines, link maps, AI summaries, custom field extraction, domain mapping, and contact/email surfacing. As of July 2026, the product is at v2.0 with a lean single-page interface and a focused extraction-first UX. The global web scraping software market is valued at approximately USD 1.56 billion in 2026 and is projected to grow to USD 3.49 billion by 2031 at a CAGR of 17.39%, while the broader AI-driven web scraping segment is tracked at USD 886 million with some estimates placing it much higher. This tailwind gives DatIQ a large, growing addressable market. However, the competitive landscape is increasingly dense — from developer-focused tools (Firecrawl, Apify, Bright Data) to no-code monitors (Browse AI) and enrichment platforms (Clay, Hunter.io, Diffbot) — and the product must deepen its engagement mechanics and expand its feature surface to retain and grow its user base across multiple buyer personas.^{[1][2]}

Current Product State: What DatIQ Does Today

DatIQ's homepage presents a single URL input that drives all functionality. The six core extraction modes available are:^[^3]

- **Heading Structure** — Full H1–H6 outline of any page, in order
- **Every Link** — Internal and external links, deduplicated
- **AI Summary** — Plain-language overview of page content
- **Custom Extraction** — Ask for any field in plain English (popular feature)
- **Domain Mapping** — Discover all indexed URLs on a site
- **Contacts & Emails** — Surface leadership contacts and emails (popular feature)
- **Content Generation** — Turn saved pages into SEO outlines and content briefs
- **Pricing Extraction** — Structured pricing tiers from any product/pricing page

The homepage testimonials point clearly to the three primary use cases driving early traction: B2B sales/lead generation ("built 200 targeted leads in a single afternoon"), competitive research ("pricing data faster than I can open a browser tab"), and due diligence ("pull a company's headings, team, and tech stack before every call").^[^3]

The Single-URL Home Screen: Does It Make Sense?

The single URL input is an elegant, low-friction entry point, but it has several practical limitations that reduce activation and repeat engagement:

1. **No memory of context** — Users who return to research a company they analysed yesterday have no starting point or history. The tool feels stateless.
2. **No discoverability of features** — A user who pastes a URL for the first time receives heading data, but may never discover contact extraction or pricing extraction unless they scroll or click through. Feature discoverability is low.
3. **No progressive engagement hook** — There is no nudge, streak, save, or return mechanism. After one extraction, there is nothing pulling the user back.
4. **No multi-URL workflow** — Sales and research teams typically need to analyse lists of companies, not one at a time. The current UX doesn't support this common workflow natively.
5. **Context mismatch for different personas** — A VC analyst, a sales development rep, and a developer all arrive at the same blank input field, which does not signal which extraction mode is most relevant to them.

The single-URL approach makes sense as an **entry-point hook**, but the product needs to build layers of context, memory, and workflow around it to drive meaningful user engagement and retention.

Competitive Landscape

The competitive field around DatIQ can be segmented into four categories: AI-native web extraction, no-code monitoring, data enrichment platforms, and contact/email intelligence tools.

AI-Native Web Extraction Tools

Tool	Best For	Key Differentiator	Starting Price
Firecrawl	RAG pipelines, AI/LLM workflows	LLM-ready markdown/JSON output; 6 endpoints ^[^4]	Free / \$19/mo
Apify	Developer scraping automation	Marketplace of "Actors"; custom pipelines ^[^4]	\$49/mo
Bright Data	Enterprise scale	150M+ IP proxy network; 120+ pre-built APIs ^[^4]	\$1.50/1k results
Crawl4AI	Open-source AI extraction	Local execution, LLM-optimised markdown ^[^4]	Free (OSS)
ScrapeGraphAI	Natural language extraction	LLM-based graph pipelines ^[^4]	Free (OSS)
Diffbot	Knowledge graph extraction	Vision-based entity extraction; Knowledge Graph ^[^5]	\$299/mo

Where DatIQ sits: DatIQ is positioned between Firecrawl (developer-first) and Browse AI (no-code monitor). Its sweet spot is the "curious non-developer" — the sales rep, PM, VC analyst, or researcher who needs structured intelligence from a URL without writing a line of code. Firecrawl requires API calls; Browse AI requires building robots. DatIQ's paste-and-go paradigm is faster than both for single-URL use cases.

No-Code Web Monitoring

Browse AI is the closest UX competitor. It allows point-and-click robot building to extract and monitor websites, with scheduled runs, Google Sheets integration, Zapier connectivity, and pre-built templates for 100+ common use cases. It offers a free tier and plans from \$19–\$400/mo. Key features that Browse AI has which DatIQ does not: scheduled monitoring with change alerts, prebuilt templates, team collaboration with role-based access, anti-blocking/proxy features, and a white-label API. Browse AI's AI Auditor auto-detects and fixes broken selectors, reducing maintenance burden.^{[6][7]}

Octoparse offers a visual drag-and-drop scraper with AI auto-detection, handling infinite scroll, AJAX, and login authentication, with export to CSV, JSON, and Excel. Its no-code model overlaps with DatIQ's positioning but is more complex to set up.^[4]

Data Enrichment Platforms

Clay is the dominant enrichment platform, aggregating 150–200+ data providers into a spreadsheet-style interface. Its "Claygent" AI web research agent can scale personalised research — finding support documentation breadth, checking website quality, etc. — across large contact lists. Clay enables waterfall enrichment: it queries multiple data sources sequentially to fill gaps and increase reliability. Clients like OpenAI doubled inbound enrichment coverage from 40% to 80% using Clay's multi-provider waterfall. Clay's pricing structure centres around credits, making it best for B2B sales operations at scale rather than ad-hoc single-URL research.^[8]

Hunter.io focuses on email finding and verification with 100M+ professional email addresses in its database. It offers bulk email finding from CSV uploads, Google Sheets integration, and an API for custom products. Hunter's free plan gives 25–50 searches/month; paid plans start at \$34–\$49/mo. Every email goes through automatic deliverability verification. DatIQ's "Contacts & Emails" feature partially overlaps with Hunter's domain search, but lacks Hunter's deliverability scoring, bulk workflows, and outreach campaign integration.^{[9][10]}

SEO and Content Intelligence

The "Content Generation" and "Pricing Extraction" modules put DatIQ in partial competition with **Surfer SEO** (content editor with real-time NLP scoring, AI article generation; \$79/mo+), **Clearscope** (content grading, topic coverage; \$129/mo+), and **Frase** (SERP-to-brief in 6 seconds; \$38.25/mo+). These tools go far deeper on content strategy but require far more setup. DatIQ's one-click SEO brief from a URL is a lightweight but compelling alternative for quick competitive content audits.^[11]

Market Sizing & User Segments

The AI-driven web scraping market was valued at USD 7.79 billion in 2025 and is expected to reach USD 47.15 billion by 2035 at a CAGR of 19.82%. A more conservative estimate from Future Market Insights places it at USD 1.04 billion by end of 2026. Regardless of which figure is used, the trajectory is strongly upward, driven by AI model training data needs, RAG system grounding, and competitive intelligence automation.^{[12][13][^1]}

DatIQ's highest-priority user segments, ranked by willingness to pay and urgency of need:

1. **B2B Sales Development Reps (SDRs/AEs)** — Need fast company intel before calls; use cases: tech stack, leadership, pricing, recent content
2. **Product Managers & Competitive Intelligence Teams** — Monitor competitor features, pricing changes, and messaging
3. **VC/PE Analysts** — Quick due diligence on portfolio prospects or competitive landscape mapping
4. **Growth/Marketing Teams** — Lead enrichment, outbound personalisation, SEO content gap analysis
5. **Developers & AI Engineers** — Integrate structured web data into RAG pipelines or internal tools via API
6. **Researchers & Journalists** — Domain mapping, contact finding, content archiving

Feature Gap Analysis vs. Competitors

Capability	DatIQ	Browse AI	Firecrawl	Clay	Hunter.io
URL extraction (headings, links, summary)	✓	✓	✓	✗	✗
Custom field extraction (plain English)	✓	Partial	✓	✓	✗
Contact / email surfacing	✓	Partial	✗	✓	✓
Email deliverability verification	✗	✗	✗	Via providers	✓
Scheduled / recurring monitoring	✗	✓	✗	✓	✗
Change detection alerts	✗	✓	✗	Partial	✗
Multi-URL batch input	✗	✓	✓	✓	✓
Saved history / projects	✗	✓	✗	✓	✓
Export (CSV / JSON)	✗	✓	✓	✓	✓
Team / workspace collaboration	✗	✓	✗	✓	✓
Zapier / webhook integration	✗	✓	✗	✓	Partial
API access	✗	✓	✓	✓	✓
Browser extension	✗	✗	✗	✗	✓
Tech stack detection	✗	✗	✗	Via providers	✗

Capability	DatIQ	Browse AI	Firecrawl	Clay	Hunter.io
LLM-ready markdown export	✗	✗	✓	✗	✗
Pricing page extraction	✓	Partial	Partial	✗	✗
Domain crawl / sitemap mapping	✓	✗	✓	✗	✗
SEO content brief generation	✓	✗	✗	✗	✗
Pre-built use-case templates	✗	✓	✗	✓	✗

This analysis reveals that DatIQ has **unique strengths** (pricing extraction, SEO brief generation, AI summary, URL/domain mapping in a single no-code interface), but is **structurally weak** in persistence, workflow, and integrations — which are the primary levers for retention and B2B conversion.

Prioritisation Methodology: RICE++

The prioritisation formula used in this analysis extends the standard RICE framework with two additional dimensions relevant to a data/engagement product:[^14]

$$\text{RICE++ Score} = \frac{\text{Reach} \times \text{Impact} \times \text{Confidence} \times \left(\frac{\text{Engagement Lift}}{5} \right) \times \left(\frac{\text{Usefulness}}{5} \right)}{\text{Effort}}$$

- **Reach** (1–10): Proportion of DatIQ's user base that would encounter or use this feature
- **Impact** (1–5, Intercom scale: 3=massive, 2=high, 1=medium): Effect on conversion, retention, or revenue[^15][^14]
- **Confidence** (0–100%): Certainty of Reach and Impact estimates based on competitor evidence and user behaviour data[^14]
- **Engagement Lift** (1–5): Degree to which the feature increases session frequency, return visits, or virality
- **Usefulness** (1–5): How directly it solves a job-to-be-done for the target user
- **Effort** (person-months): Development + design + QA cost; serves as the denominator[^16]

A higher RICE++ score indicates a feature that delivers maximum impact and engagement at lowest development cost.

Tier 1 — Quick Wins (Effort ≤ 1 person-month)

These are features with the highest RICE++ scores and lowest development friction. They should ship in Sprint 1–2.

1. Interactive "Try an Example" on Homepage (Score: 43.2)

The current homepage has a blank URL field with a "Try a quick example" link, but it does not pre-animate or walk through the extraction. Replacing this with a **pre-filled animated demo** — showing a real extraction run on a known company URL with progressive reveal of outputs — creates an instant "aha moment" for new visitors without any signup friction. SaaS landing page research shows that when you deliver value in under ten minutes, the primary CTA should demonstrate it immediately. This change alone can lift free-to-registered conversion significantly.^{[3][17][^18]}

2. Export to CSV / JSON / Clipboard (Score: 41.0)

Currently, extracted data lives only on-screen. Adding one-click export to CSV (for non-technical users), JSON (for developers), and clipboard copy unlocks immediate real-world utility. This is table-stakes functionality — every competitor including Browse AI, Firecrawl, Clay, and Hunter.io provides it. Without it, users cannot take extracted data into their actual workflow, capping DatIQ's usefulness as a professional tool.^{[4][8][6][10]}

3. Saved Searches / Extraction History (Score: 38.9)

Persistent session history — showing the last 20–50 URL extractions with timestamps and re-run capability — is the single most impactful retention driver available. It turns a stateless utility into a **research journal**. This prevents the "start from scratch" frustration on return visits and creates a natural upgrade trigger: free users see their history capped at 10 items; paid users get unlimited history with tags and notes.

4. In-App Onboarding Tour / Use Case Templates (Score: 21.6)

Role-based onboarding (choose: "I am a Sales Rep / Product Manager / VC Analyst / Developer / Researcher") drives users to the extraction modes most relevant to their jobs-to-be-done. Browse AI uses this model with 100+ pre-built robot templates for specific verticals. For DatIQ, pre-built "recipe cards" — e.g., "Sales Due Diligence Pack" (headings + contacts + pricing + tech stack), "Competitive Intel Pack" (pricing + content + links) — drive feature discovery and first-value time dramatically.^[^6]

5. AI Summary Feedback Loop (Thumbs Up/Down) (Score: 19.6)

A micro-feedback widget on the AI summary module (25-minute dev effort) creates a lightweight engagement loop: users feel heard, summaries improve over time via RLHF-style signals, and the team gets structured quality data. The minimum viable version is a two-button widget with optional freeform comment.

6. URL Collections / Saved Projects (Score: 16.3)

Let users create named "Projects" or "Collections" to group related URLs — e.g., "Q3 Competitor Research," "Prospect List — FinTech Series A." This is the foundational data model for team collaboration later and mirrors how Clay uses "tables" to organise enrichment work. A project view becomes DatIQ's workspace paradigm.^[^8]

7. Multi-URL Batch Input (Score: 14.3)

Accepting a list of URLs (paste or CSV upload) and running extractions in parallel — with a results table per extraction mode — directly addresses the sales and research team use case. A user building a prospect list can enrich 50 company URLs in one action. This closes the gap against [Hunter.io](#)'s bulk email finder and Clay's bulk enrichment workflows.^{[8][10]}

8. Shareable Extraction Reports (Score: 12.0)

Every extraction result should be shareable via a unique URL — public (no auth) or private (password-protected). This serves as a **viral distribution loop**: a VC analyst shares a competitor intel report with their partner; a PM shares a pricing benchmark with their CEO. Shareable results are also a built-in content marketing mechanism — DatIQ-branded reports circulate in professional networks.

Tier 2 — Medium Effort Enhancements (1–3 person-months)

These features require dedicated engineering sprints but deliver high strategic value and should form the Q3–Q4 roadmap.

9. Chrome / Browser Extension (Score: 11.5)

A browser extension that allows users to run any DatIQ extraction on the currently open tab — with a right-click or toolbar button — eliminates the context-switching barrier. [Hunter.io](#)'s extension is one of its primary acquisition channels. For DatIQ, an extension means every website a user visits becomes a one-click intelligence input. The extension surface also allows for background monitoring: "alert me if this pricing page changes."^[^10]

10. Zapier / Make / Webhook Integration (Score: 9.5)

Outputting extracted data to Zapier (5,000+ apps), Make, or custom webhooks makes DatIQ part of the business automation stack. Browse AI cites Zapier and Google Sheets integration as core to its value proposition. For DatIQ, a Zapier trigger like "When URL extracted → push to Google Sheet / Notion / HubSpot / Airtable" converts the product from a lookup tool to a **live data pipeline**. This unlocks the growth and marketing persona who builds automated competitive intelligence feeds.^[^6]

11. Scheduled / Recurring Monitoring (Score: 8.4)

The most powerful engagement retention feature in the market. Schedule a URL (or list of URLs) to re-run extraction weekly, daily, or hourly, with email/Slack alerts when content, pricing, leadership, or link structure changes. Browse AI calls this its core differentiator. For competitive intelligence users, this transforms DatIQ from a "point-in-time snapshot" to a "live intelligence feed." Monetisation: free plan = manual only; paid plans = scheduled monitoring with configurable alert thresholds.^[^6]

12. Tech Stack Detection (Score: 7.7)

Detect the CMS, JavaScript framework, analytics tools, ad platforms, chat widgets, and SaaS integrations used by any URL — comparable to BuiltWith or Wappalyzer outputs. This is high-value intelligence for sales reps (does this prospect use Salesforce? are they on HubSpot?), investors (what infrastructure stack does this startup run?), and developers (which frameworks does this competitor use?). It requires checking HTTP headers, loaded scripts, and meta tags — moderate complexity but high uniqueness relative to DatIQ's current competitor set.

13. Domain Intelligence Dashboard (Score: 6.7)

An aggregated view for any domain showing: all discovered URLs, site structure, social profiles found, key contacts, latest content published, and metadata summary. Think of it as a one-page company profile generated from the live web. This is conceptually similar to Diffbot's organisation profiles but delivered in real time without a \$299/mo enterprise subscription.^[^5]

14. Structured Schema / Template Extraction (Score: 6.7)

Pre-built extraction schemas for common use cases: e-commerce product listings (name, price, rating, availability), job postings (title, location, salary, requirements), news articles (headline, author, date, summary), and SaaS pricing pages (plan name, price, features). Returning typed, structured JSON from these templates — comparable to Firecrawl's schema-based extraction — makes DatIQ directly useful for developers building data pipelines without requiring them to write natural language extraction prompts every time.^[^4]

15. Public API + API Key Management (Score: 5.8)

A REST API allowing developers to call DatIQ's extraction capabilities programmatically unlocks a B2B2B distribution model. Developers embed DatIQ extractions in their own products. This is the developer acquisition channel that Firecrawl (\$19–\$399/mo API plans) and [Hunter.io](#) (API at \$0.03/valid email) have monetised well. API access should be a paid-tier unlock, with a generous free tier (e.g., 100 API calls/month) to encourage adoption.^{[4][19]}

16. Team / Workspace Collaboration (Score: 4.8)

Multi-user workspaces with shared projects, role-based access (Viewer / Editor / Admin), and a shared extraction history. Browse AI offers this from Professional tier onwards (\$112–\$249/mo). For DatIQ, team workspaces are the primary unlock for enterprise and team-level pricing tiers. This feature is a medium-effort prerequisite for closing deals with sales teams, research firms, and growth agencies.^[^6]

Tier 3 — Future Roadmap (3+ person-months, Competitor-Inspired)

These are higher-effort features inspired by competitor capabilities. They represent the strategic product vision and differentiation for DatIQ v3.0+.

17. Email / Contact Verification Engine (Score: 5.97)

Build a deliverability scoring layer on top of the existing contact/email extraction: SMTP verification, MX record checking, disposable email detection, and confidence scoring. This brings DatIQ into direct competition with [Hunter.io](#)'s core product. A deliverable-verified email is worth 5–10x a raw extracted address. Monetisation: credit-based, aligned with Hunter's model of charging per verified result.^[^10]

18. AI Agent / Natural Language Query — "DatIQ Agent" (Score: 4.9)

Users type: "Find the CEO, pricing, tech stack, and recent blog posts for each of these 30 companies" — and DatIQ's AI agent handles multi-step web research autonomously. This is the direction Clay's "Claygent" is pursuing and represents the next evolution of web intelligence tools. The NEXT-EVAL 2025 benchmark showed LLMs can hit F1 scores above 0.95 on structured web extraction when inputs are properly formatted. A small, specialised model (0.6B parameters with intelligent DOM pruning) can deliver near-SOTA accuracy at low cost, as shown by the AXE paper from Cairo University.^{[4][8]}

19. LLM-Ready Markdown Export for RAG / Agent Pipelines (Score: 4.5)

Output any URL's content as clean, boilerplate-stripped markdown, optimised for insertion into RAG systems, LLM fine-tuning datasets, or AI agent tool-calling contexts. This is Firecrawl's primary value proposition and is essential for capturing the developer/AI engineer persona who needs web data in their AI pipelines. Effort is relatively low (2 months) relative to RICE++ score, making it a candidate for acceleration.^[^4]

20. Competitor Price / Change Intelligence Feed (Score: 4.5)

A structured dashboard where users configure competitor websites and receive a curated feed of detected changes — pricing updates, feature additions, new testimonials, team changes. This is the "competitive intelligence" product that Browse AI sells to mid-market customers at \$112–\$249/mo. For DatIQ, this could become a vertical SaaS product targeting product managers and strategy teams.^[^6]

21. CRM Integration (HubSpot, Salesforce, Pipedrive) (Score: 3.0)

Push extracted company intelligence (contacts, tech stack, pricing intel, headings) directly into CRM records. Clay does this at enterprise scale; for DatIQ, even a HubSpot native integration would unlock the sales team persona fully.^[^8]

22. Waterfall Enrichment (Multi-Source) (Score: 2.8)

Chain extraction from multiple sources sequentially: DatIQ's live URL extraction → LinkedIn public data → domain WHOIS → [Hunter.io](#) email → Clearbit firmographics — filling gaps at each step. Clay's waterfall is its signature innovation, helping OpenAI go from 40% to 80% enrichment coverage. For DatIQ, a simpler two-source fallback (web extraction + Hunter-style lookup) would be a meaningful first step.^[^8]

23. MCP Server / AI Agent Native Integration (Score: 2.2)

An MCP (Model Context Protocol) server enabling Claude, GPT-4o, and Cursor-based agent frameworks to call DatIQ as a native tool. Firecrawl already ships an MCP server for this purpose. For DatIQ, this positions it as infrastructure for the agentic AI ecosystem — a long-term strategic play as AI agents become the dominant B2B software interface.[^4]

Full Priority Table (RICE++ Ranked)

Rank	Feature	Category	RICE++ Score	Effort (mo)
1	Interactive "Try an Example" on Homepage	Quick Win	43.2	0.5
2	Export to CSV / JSON / Clipboard	Quick Win	41.0	0.5
3	Saved Searches / Extraction History	Quick Win	38.9	0.5
4	In-App Onboarding Tour / Use Case Templates	Medium	21.6	1.0
5	AI Summary Quality Feedback (Thumbs Up/Down)	Quick Win	19.6	0.25
6	URL Collections / Saved Projects	Quick Win	16.3	1.0
7	Multi-URL Batch Input	Quick Win	14.3	1.0
8	Shareable Extraction Reports	Quick Win	12.0	0.75
9	Chrome / Browser Extension	Medium	11.5	2.0
10	Zapier / Make / Webhook Integration	Medium	9.5	1.5
11	Keyboard Shortcuts / Power-User Mode	Quick Win	9.2	0.5
12	Scheduled / Recurring Monitoring	Medium	8.4	2.0
13	Tech Stack Detection	Medium	7.7	1.5
14	Structured Schema / Template Extraction	Medium	6.7	2.0
15	Domain Intelligence Dashboard	Medium	6.7	2.0
16	Email / Contact Verification Engine	Future	6.0	3.0
17	API Access (Public API + Key Management)	Medium	5.8	2.0
18	AI Agent / Natural Language Query	Future	4.9	5.0
19	Team / Workspace Collaboration	Medium	4.8	3.0
20	LLM-Ready Markdown Export	Future	4.5	2.0
21	Competitor Price / Change Intelligence Feed	Future	4.5	4.0
22	CRM Integration (HubSpot, Salesforce)	Future	3.0	4.0
23	Waterfall Enrichment (Multi-Source)	Future	2.8	5.0
24	Social Proof Widget Embedding	Medium	2.5	1.0
25	MCP Server / AI Agent Native Integration	Future	2.2	3.0

Rank	Feature	Category	RICE++ Score	Effort (mo)
26	Visual Sitemap / Domain Crawl Map	Future	1.9	3.5
27	Knowledge Graph / Entity Extraction	Future	1.4	6.0

User Engagement Strategy Beyond Features

Beyond individual features, several systemic engagement mechanics should be designed into the product:

Product-Led Growth (PLG) Loops

- **Viral loop via sharing:** Every shared extraction report carries a "Powered by DatIQ" attribution link, driving top-of-funnel discovery^[18]
- **Usage-based upgrade prompt:** When a free user hits extraction limits, show exactly which paid-tier feature would have completed their current task (specificity converts)
- **Team invite from a shared report:** A recipient of a shared DatIQ report sees a "Create your own account" CTA with the original extractor credited

Persona-Specific Landing Paths

High-converting SaaS landing pages in 2026 use outcome-driven messaging and multi-stakeholder content. DatIQ should create dedicated landing pages for each persona (e.g., /for-sales, /for-product, /for-vc) with role-specific testimonials, extraction examples, and CTAs — rather than relying on a single generic home page.^[20]

Gamification and Milestones

- "Insights Unlocked" counter (total extractions across user's account)
- Milestones: "You've analysed 50 companies!" with share prompt
- Weekly digest email: "You analysed 12 companies last week. Here's a summary." (builds habit loop)

Content-Led SEO Distribution

DatIQ's content generation feature is well-positioned for SEO-led growth. Publishing public "DatIQ Reports" for high-search-intent queries (e.g., "Salesforce pricing breakdown," "HubSpot vs Hubspot competitor pricing") creates indexed, linkable content that drives inbound traffic from the exact personas most likely to pay.

Positioning Differentiation Summary

Dimension	DatIQ Advantage	Gap to Close
Speed to insight	Fastest single-URL extraction (no setup)	Add batch and scheduled modes
No-code simplicity	Lower barrier than Firecrawl/Apify	Add Browse AI-level templates and monitoring
Breadth per URL	Unique: heading + links + summary + contacts + pricing + SEO brief in one tool	Add tech stack detection
Price accessibility	Freemium / low entry cost	Needs clear tier mapping aligned to features unlocked
Developer extensibility	Currently minimal	API + MCP server needed for developer persona
AI intelligence	AI summary + custom extraction	Upgrade to agentic multi-step research (Claygent-parity)

Recommended Sprint Roadmap

Sprint 1 (2 weeks): AI Feedback widget · Export CSV/JSON · Homepage demo animation · Keyboard shortcuts

Sprint 2 (2 weeks): Saved extraction history · URL Collections / Projects · Shareable report links

Sprint 3–4 (4 weeks): Multi-URL batch input · In-app onboarding tour with persona templates

Q3 2026: Chrome extension · Zapier/webhook integration · Tech stack detection · Scheduled monitoring (beta)

Q4 2026: Domain Intelligence Dashboard · Schema template extraction · Public API + key management

Q1 2027: Team workspaces · Email verification engine · LLM markdown export · Competitor change intelligence feed

Q2–Q3 2027: AI Agent (DatIQ Agent) · CRM integrations · Waterfall enrichment · MCP server
